In this section give an in depth discussion on the process used to solve homogeneous, linear, second order differential equations, $ay'' + by' + cy = 0$. We derive the characteristic polynomial and discuss how the Principle of Superposition is used to get the general solution.

Ordinary Differential Equations / Dynamical Systems

One of the stages of solutions of differential equations is integration of functions. There are standard methods for the solution of differential equations. Should be brought to the form of the equation with separable variables x and y, and integrate the separate functions separately. To do this sometimes to be a replacement.

Perko is decent introduction to dynamical systems, but it is best used with a few supplementary texts (specifically, Smale, Hirsch and Devaney's Differential Equations, Dynamical Systems, and an Introduction to Chaos, and V.I. Arnol'd's Ordinary Differential Equations). I agree with the reviewer who calls it "a very good graduate ODEs textbook with some flaws" - that's generally how I felt ...

Sometimes there is no analytical solution to a first-order differential equation and a numerical solution must be sought. The first-order differential equation $dy/dx = f(x,y)$ with initial condition $y(x_0) = y_0$ provides the slope $f(x_0,y_0)$ of the tangent line to the solution curve $y = y(x)$ at the point (x_0,y_0) .
