orthogonal communication system complex should be made as large as possible to reduce E<sub>Jeff</sub>, i.e., the complex should be designed to use all of the available bandwidth. The energy-optimal communication strategy (K S 1) using a single one of the K available communication links, is called a pure spread-spectrum strategy.

The formal definition of spread spectrum is more precise: an RF communications system in which the baseband signal bandwidth is intentionally spread over a larger bandwidth by injecting a higher frequency signal (Figure 1). As a direct consequence, energy used in transmitting the signal is spread over a wider bandwidth, and appears as noise.
